kgav — architecture as wired in code

audit 2026-11-03 · release v0.1 · 78,789 nodes · 392,907 edges

red ①–⑧ = known defect, see key at the bottom

Known defects details and fixes: docs/audit_2026-11-03_fixes.md

① PPI edges carry database release dates (2023, 2024), so the 2021 training graph has no PPI edges

② GtoP and similarity edges are dated 1970 ("undated"), so they leak into every training graph

③ 69% of "has antiviral activity" edges are actually measured-inactive results

④ 71% of labelled compounds have no other edge, so no metapath can reach them

⑤ The degree baseline (AUC 0.62) beats every reasoning channel (0.58 or less)

⑥ About 150 tests with no multiple-testing correction; Hits@k depends on tie order

⑦ Headline claims in the docs contradict the results files

⑧ Reach caveat never loads; triage ranks using held-out labels
